## Beschreibung

Most PHP developers who sell their scripts know this:

After a short time, your script gets cracked by someone and served for download on warez sites.

As nobody buys your script anymore but downloads it on those warez sites, you don't earn money for your work.

Stop this!

Now you can use SourceLock to encode your source code and prevent crackers from stealing your code!

Sure - no encoding/encryption is 100% safe (unlike many other manufacturers of such PHP encoders are stating).

But SourceLock encrypts your code with many encryption and obfuscation algorithms and compiles it to bytecode - most crackers won't be able to break this "security lock".

Also, the decoder engine is restructured and recompiled each time you encode a file, and the 512-Bit encryption keys also change.

SourceLock encoded scripts are safe and run with almost no performance loss!

No additional PHP modules required!

SourceLock doesn't need any loaders on your client's server - files encoded with SourceLock decode and execute themselves at runtime.

But encoding is not the only feature!

You can also create trial versions of your scripts which expire on a certain date, or lock the script to specified domain(s) and/or IP address(es)!
