Description

It is important to note JSP is just one language with which Java objects can be accessed. PHP also can also integrate with Java, which means that it can be used as the scripting language for activating Java logic, just as much as JSP can. Unlike JSP, however, PHP also integrates with other component models, such as Microsoft's COM, and adding support for new object models is extremely easy. This means PHP's extensibility is infinite. JSP, on the other hand, is completely dependent on Java.
