Description

htmlArea is a WYSIWYG editor replacement for any textarea field. Instead of teaching your software users how to code basic HTML to format their content, they can use htmlArea to:

- Format text to be bold, italicized, or underlined.

- Change the face, size and colour.

- Left, centre, or right-justify paragraphs.

- Make bulleted or numbered lists.

- Indent or un-indent paragraphs

- Insert a horizontal line.

- Insert hyperlinks and images.

- View the raw HTML source of what they're editing.

- You can also create your own buttons to insert custom blocks of HTML code and images.
