### Produktbild

### Beschreibung

PHPGem is a PHP-script which accelerates the creation of PHP-scripts for working with tables. It works with different SQL-servers such as PostgreSQL, MySQL, mSQL, ODBC, and Adabas. You input a description of and parameters for your tables' fields (field name, on/off searching in the field, etc.), and PHPGem outputs another PHP-script which will work with the tables (view/add/edit/delete/duplicate entries and search). PHPGem works with multi-level nested tables. PHPGem allows you to specify a level of access for each table and for each field for each user. PHPGem also support images.
