Beschreibung

SPGM is a simple PHP script that displays picture galleries on the web. It is intended to provide a very straightforward way to set up online photo albums: create directories, fill them with pictures and upload.

SPGM generates HTML 4.01 compliant code and makes extensive use of CSS stylesheets to render galleries. It only requires PHP version 3 or higher and does not rely on image manipulation libraries (like GD), or any database system. A few features: caption for each gallery/picture, infinite sub-galleries hierarchies, per gallery complete configuration (inheritance supported), new pictures highlighting (filtering available), multi-language support, themes available for use.
