Beschreibung

"Jacks FormMail.php" is a generic WWW form to e-mail gateway, which will parse the results of any form and send them to the specified user. This script has many formatting and operational options, most of which can be specified through the form, meaning you don't need any programming knowledge or multiple scripts for multiple forms. This also makes FormMail the perfect system-wide solution for allowing users form-based user feedback capabilities without the risks of allowing freedom of CGI access. There are several downloading options available below and more information on this script can be found in the Readme file.
