Beschreibung

PHP Secure Web is a security model, that could be applied to websites written in PHP scripting language using any kind of a database. We used ADOdb, and generic SQL queries, so it became database independent, as well as OS independent due to the nature of PHP. May be we didn't look around hard enough to find a good security system that could do anything we want, but the ones that we saw were having the lack of a bit more complex security than the one we offer.
