### Beschreibung

phpSecurityAdmin is a PHP application that was designed to be implemented in custom Content Management Systems (CMS). It is designed to be easy to use, so that CMS programmers do not have to spend a lot of time managing user access. It can be used for controlling access to Web pages based on user names and passwords. The system allows the client to manage user accounts and access rights, and to add, edit, or delete users. It also features "user profiles" which provide an efficient method for creating multiple users with similar access rights. It includes localization support and a few language translations.
