**Beschreibung**

LedAds is the second generation of Ledscripts.com's perl-based banner program. This version offers many improvements over not only the previous version, but also many other ad programs on the market. Features: More secure data storage - Data is now stored in DBM files, helping to prevent data corruption; Two Ad Types - You can use standard ad banners or use your own rich-media adcode (such as the one from an ad company); Random Number Generation - You can now insert random numbers into the Rich-Media (This allows you to dynamically create what ad your ad company may call 'unique keys' for each time the ad is displayed); Image Uploads and Storage - You can upload your ad banners right from the control panel, and let the program take care of all the storage and retrieval; Full Stats - Stats tracked per day, per month, per year and lifetime; and much more.
