Produktbild	Image not found or type unknown
Description	Beautifier highlights and indents source code using highlight configuration files (which are similar to Ultraedit highlighting files). As such, it supports C, C#, Java, Perl, PHP, Pascal, Lisp, Mumps, Eiffel, Euphoria, and x86 Assembler, amongst others. Beautifier handles line/block comments, keyword highlighting, correct indentation, and string highlighting, as well as the harvesting of comment text to allow for easy source code indexing.
