### Produktbild

### Description

emailform is written in and for php4. it is a very easy way to send data gathered with a form to an email recipient.

some of the features are...

- the email message will be made automatically
- all fields that are transmitted via http post will be put into the email message
- you may suppress some fields
- you may check that mandatory fields are filled in
- you do not need to change the code, even if you make changes to the html form that will be processed
- there are only three (3) lines of code necessary to process a html form
