Description

The CJ Web2Mail is a very simple web page form to your email inbox script. All the script does is send the contents of a form, submitted by a visitor to your website, to your email inbox. The script comes with no advertising but a link back would be appreciated. Please however, keep the comment tags in "sendmail.php" intact.

V2.0 comes with more advanced error checking. It allows the sender to specify a subject to the webmaster - making email selection more prioritised. It also allows you to use your own thank you message.
