Description

On Unix-like operating systems, such as Linux, you can use the system's semaphores and shared memory through PHP's sysvsem and sysvshm modules.

Those modules are not available on the Win32 platform.

phpWin32SxM is a solution for all those who want to use the functions that the modules sysvsem and sysvshm provide. phpWin32SxM emulates semaphores and shared memory through SQL tables.
